Mega Tyvek for Strong Contenders is designed for maximum strength and durability. The Mega Tyvek is suitable to be used for cable labelling, wrist bands, jewellery tagging and a host of applications that requires a durable and anti-tear material with permanent adhesion.

Mega Tyvek is a matt-white, calendared and corona-treated face film made from spun-bonded polyolefin fibres. It has extremely high tear strength coupled with good weather and chemical resistance for enhanced durability in a range of extreme conditions.

Our permanent RP33 adhesive is specially developed for use with the Mega Tyvek, supplying good tack and the high cohesion needed for adhesive-to-adhesive applications where the label folds onto itself.

Mega Tyvek is typically used for cable labelling, but also delivers just the right functionality in end-uses such as carat and price markings on jewellery and spectacle frames, and as wrist bands in hospital use or access control at events.

Security - Cuts are available for this label.
